

Ortho

Local-first architecture review for AI-generated code.

Your source never leaves your machine.

WHAT IS ORTHO

Ortho scans your Python repo, builds a real architecture model — call graphs, import graphs, layer detection — and finds violations that AI coding tools introduce before they merge. Every finding cites the actual evidence: the real import edge that crosses a boundary, the exact cycle chain, the measured line counts. No guesses.

It also remembers what you rejected. When you flag a finding as a false positive:

- Stored in `.ortho/ortho.db` — a local SQLite file in your repo root
- Next scan cites: "Rejected 2026-07-10: violates service boundary. Intentional shortcut."
- The AI coding tool stops suggesting what you've already said no to.

WHAT PILOTS GET

- Free access to Ortho v3 (CLI + MCP server)
- Personal 30-min onboarding call — we run the first scan together
- Weekly 30-min check-in for the first month
- Direct line to the founder for bugs and questions
- Zero telemetry. Zero network calls during scan.

WHAT WE ASK

- Run ortho scan on one real internal repo (not a toy project)
- 30 min/week: attend check-in, share what you found
- Honest feedback — especially when Ortho is wrong or confusing

WHAT YOU KEEP

Everything. Your scan data lives in `.ortho/ortho.db` on your machine. Delete it anytime. No account. No API key. No vendor lock-in. If you stop using Ortho, there is nothing to cancel.

QUICK START

```
# Windows (PowerShell – one command)

irm https://adithyak3106.github.io/Ortho-community/install.ps1 | iex

# macOS / Linux

git clone https://github.com/AdithyaK3106/Ortho.git && cd Ortho && ./install.sh

# Then, from any repo:

ortho guardrails

ortho decide "add Redis caching to the API layer"
```

Prerequisites: git, python, pip, node, npm. The installer clones the repo, pip-installs all 13 packages in editable mode, builds the TypeScript CLI, and scans the repo you point it at. MCP server path: *apps/mcp-server/ortho_mcp_server.py*

WHY LOCAL-FIRST

	Ortho	CodeRabbit / Greptile / Qodo
Source stays on your machine	Yes	No — sent to cloud
SOC2 / HIPAA compatible	Yes	Requires vendor review
No account or API key required	Yes	Account required
Remembers rejected decisions	Yes	No
Works offline	Yes	No
